Garage Door Air Curtains could help you save money by drastically reducing the amount of heat loss through garage doors. It is necessary to maintain garage temperatures above 50 °F to prevent wet-run sprinkler pipes from freezing and bursting.

Every time your garage doors open in the winter a rush of cold air enters the garage increasing the demand on the heating system. Garage Door Air Curtains automatically blow a jet of high velocity air over the door opening to prevent air transfer between outside and inside.

Installing Garage Door Air Curtains could help you **reduce garage heating consumption up to 20%**. This would result in direct savings on monthly utility bills.
